There are some terms we need to focus on so I think we should focus on the permit for now. I've attached it.

The permit is where I got the figure for glass melted. They also document a review of the potentially applicable requirements. The 6000 pound is described as the hazardous component of the raw materials used.

I am still working a more current production number.

This is different from what Paul said – 2,144 tons of glass melted in 2009.

Madonna,

The story below includes the amount of raw material that Bullseye used in 2009 – 6000 pounds of hazardous raw materials.

I will. Susan Fairchild is the rule writer for the manufactured glass category.

Madonna, would you take the lead and contact OAR about this, and keep us all in the loop? Let me know otherwise. Thanks.

Don, could you or Madonna give your OAR contacts a heads up by forwarding to them the news articles. Let them know that the Region is working this issue, which has just come to our attention this week. We are in the process of looking at what actions make sense, and we will keep HQ-OAR informed.

Scott Downey is working through Paul Koprowski to find out if the state or EPA emergency response might be taking any immediate action.

Please copy Dave and me.

Thanks!

Jan

OCE and AWT are working on a hot issues write up on this and we are going to draft a reactive desk statement for press calls. I understand we are talking with ODEQ today on this matter. Stand by for more information. There are several other clips on this as a result of a DEQ news release of yesterday (attached).
